LAYOUT CONCEPTS

Layout Concepts ABC Shuttle - Using A Loksound V5 Decoder

Step 1 - Gap the rails to create the end-stop sections, one loco length plus the stopping distance at your chosen speed.

Step 2 - Install the two ABC modules as per the diagram above.

Step 3 - On each ABC board, set the **RED** ABC header switch to **ON**.

Step 4 - On one board, set **BLUE** ABC header switches to **ABC 1**.

Step 5 - On the other board, set **BLUE** ABC header switches to **ABC 2**.

Step 6 - Change the following CVs on your Loksound V5 Decoder:

1 - Change **CV27** to **1**.
2 - Change **CV149** to **10** - for a 10 second pause before reversing. Use a different value in **CV149** if you want a different pause time.

If the locomotive does not respond to the ABC board, swap over the **BLUE** ABC header switches on the two boards.
